

Stevedoring Firm and GreenPages Connect 40 Remote Locations and Streamline Information Acquisition

GreenPages' client, America's oldest and largest stevedoring firm, demanded a solution that could support 30 disparate applications running at 40 locations nationwide. The client originally believed they wanted to implement a solution that would set up a depot to install software on new machines and ship pre-configured machines to the location in need.

GreenPages instead suggested a thin client solution with Citrix MetaFrame that would allow the client to support all applications on a server farm at their headquarters. Now all data is located at the data center and backups are done at the same location. There was no longer any need for a depot solution. GreenPages' client is able to control the remote location desktops and retrieve the information at those locations from their corporate headquarters.

The stevedoring firm had a core IT staff of 8 people serving 450 end users before GreenPages solution. After the thin client implementation GreenPages' client now serves the same amount of end users with a staff of 2.
